

1. What is a parallel chain in LangChain, and why is it useful?
2. How does `RunnableParallel` work in LangChain?
3. In a parallel chain, how can multiple branches receive the same input simultaneously?
4. What is the purpose of using different models in different branches of a parallel chain?
5. Given the following code, what will be the structure of the output?

```
parallel_chain = RunnableParallel({  
    "summary": summary_chain,  
    "questions": question_chain  
})
```
